

# PREHOSPITAL NOTIFICATION (PHN)

FASTFACTS 2023

## Prehospital notification (PHN)

is when a hospital receives advanced notice by an ambulance or general practitioner of the imminent arrival of an acute STEMI patient, to bypass the emergency department.

**PHN is essential for patient survival as it reduces treatment delay**

PHN was utilised in

# 70%

of primary PCI cases, resulting in significant reductions in door to PCI-mediated reperfusion times

A median door to PCI-mediated reperfusion time of **47 minutes** was achieved with PHN, compared to **91 minutes** without PHN

**88%** of cases triaged with **PHN** achieved a door to PCI-mediated reperfusion time **≤90 minutes**, whereas only **49.9%** of cases achieved this target without **PHN**
